Types of Data Structure

Types of Data Structure

Data Structure Operations

Operations perform on any linear structure:

- **Traversal:** processing each element in the list
- **Search:** Finding the location of the element with a given value or the record with a given key
- **Insertion:** Adding a new element to the list
- **Deletion:** Removing an element from the list
- **Sorting:** Arranging the elements in some type of order
- **Merging:** Combining two lists into a single list

Linear Array

A **list** of finite number n of *homogeneous* data elements

- ❖ The elements of the array are referenced respectively an *index set* consisting of n **consecutive numbers**
- ❖ The elements of the array are stored respectively in **successive memory locations**

The number n of element is called the *length* or *size* of the array

Some Array Terminology

`temperature`[2]

Array name

`temperature`[`n + 2`]

Index - also called a subscript

- must be an `int`,
- or an expression that evaluates to an `int`

`temperature`[`n+2`]

Array variable or Indexed variable

`temperature`[`n + 2`] = `32`;

Value of the array or indexed variable
- also called an element of the array

Linear Array

int Student [6]	
Array Index {	0 Dalia
	1 Sumona
	2 Mubtasim
	3 Anamul
	4 Ibtisam
	5 Jarin

Student [0] = Dalia

Student [1] = Sumona

Student [2] = Mubtasim

Student [3] = Anamul

Student [4] = Ibtisam

Student [5] = Jarin

Linear Array

int Student [6]

Array Index	1	Dalia
	2	Sumona
	3	Mubtasim
	4	Anamul
	5	Ibtisam
	6	Jarin

Student [1] = Dalia

Student [2] = Sumona

Student [3] = Mubtasim

Student [4] = Anamul

Student [5] = Ibtisam

Student [6] = Jarin

Representation of Linear Array in Memory

The number n of elements is called the length or size of the array, if not defined we assume **index started from 1, 2, 3, 4,, n .**

In general the **length or the number of data elements of array** can be obtained from index set by formula:

$$\text{Length} = \text{UB} - \text{LB} + 1$$

UB is **upper bound** the largest index, and **LB** is **lower bound** the smallest index.

Representation of Linear Array in Memory

Example :

An automobile company uses an array AUTO to record the number of auto mobile sold each year from 1932 through 1984.

$$LB = 1932$$

$$UB = 1984$$

$$\text{Length} = UB - LB + 1 = 1984 - 1932 + 1 = 53$$

$AUTO[k]$ = Number of auto mobiles sold in the year K

$AUTO[1950]$ = Number of auto mobiles sold in the year 1950

Representation of Linear Array in Memory

- ❖ Let **LA** be a linear array in the memory of the computer
- ❖ $\text{LOC}(\text{LA}[K])$ = address of the element **LA**[K] of the array **LA**
- ❖ $\text{LOC}(\text{LA}[K]) = \text{Base}(\text{LA}) + w * (K - \text{lower bound})$

where, $\text{Base}(\text{LA})$ = the address of the first element of **LA**

$w \rightarrow$ length of memory location required.

For real number: 4 byte

integer: 2 byte

character: 1 byte

Representation of Linear Array in Memory

Fig : Computer memory

Representation of Linear Array in Memory

An automobile company uses an array AUTO to record the number of auto mobile sold each year from 1932 through 1984.

Suppose $\text{Base}(\text{AUTO}) = 200$, and $w = 4$.

$\text{LOC}(\text{AUTO}[1932]) = 200$, $\text{LOC}(\text{AUTO}[1933]) = 204$

$\text{LOC}(\text{AUTO}[1934]) = 208$

The address of the array element for the year $K = 1965$ can be obtained by using :

$\text{LOC}(\text{AUTO}[1965]) = \text{Base}(\text{AUTO}) + w * (1965 - \text{lower bound})$

$= 200 + 4 * (1965 - 1932) = 332$

Representation of Linear Array in Memory

4.1 Consider the linear arrays AAA(5 : 50), BBB(−5 : 10) and CCC(18).

(a) Find the number of elements in each array.

(b) Suppose $Base(AAA) = 300$ and $w = 4$ words per memory cell for AAA. Find the address of AAA[15], AAA[35] and AAA[55].

(a) The number of elements is equal to the length; hence use the formula

$$Length = UB - LB + 1$$

Accordingly, $Length(AAA) = 50 - 5 + 1 = 46$

$$Length(BBB) = 10 - (-5) + 1 = 16$$

$$Length(CCC) = 18 - 1 + 1 = 18$$

Representation of Linear Array in Memory

4.1 Consider the linear arrays $AAA(5 : 50)$, $BBB(-5 : 10)$ and $CCC(18)$.

(a) Find the number of elements in each array.

(b) Suppose $Base(AAA) = 300$ and $w = 4$ words per memory cell for AAA . Find the address of $AAA[15]$, $AAA[35]$ and $AAA[55]$.

(b) Use the formula

$$\begin{aligned} \text{LOC}(AAA[K]) &= \text{Base}(AAA) + w(K - L) \\ \text{Hence: } \text{LOC}(AAA[15]) &= 300 + 4(15 - 5) = 304 \\ \text{LOC}(AAA[35]) &= 300 + 4(35 - 5) = 440 \end{aligned}$$

$AAA[55]$ is not an element of AAA , since 55 exceeds $UB = 50$.

Traversing a Linear Array

Print the contents of each element of DATA or Count the number of elements of DATA with a given property. This can be accomplished by traversing DATA.

4.1': (Traversing a Linear Array) This algorithm traverses a linear array LA with lower bound LB and upper bound UB.

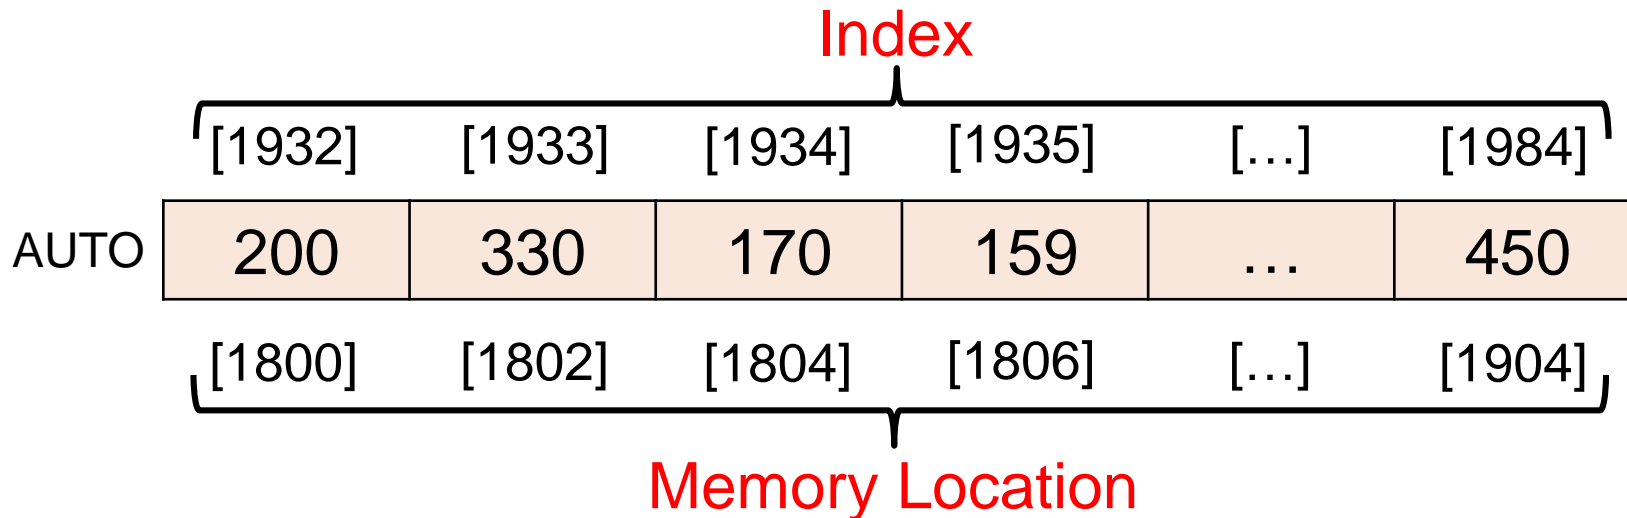

- 1.** Repeat for $K = LB$ to UB :
 Apply PROCESS to $LA[K]$.
 [End of loop.]
- 2.** Exit.

Traversing a Linear Array

An automobile company uses an array AUTO to record the number of automobile sold each year from 1932 ~ 1984.

a) Print each year and the no. of automobiles sold in that year

1. Repeat for K = 1932 to 1984:
 Print : K, AUTO[K]
2. Exit.

Traversing a Linear Array

An automobile company uses an array AUTO to record the number of automobile sold each year from 1932 ~ 1984.

a) Print each **year and the no. of automobiles** sold in that year

	<div><div></div><div>[1932]</div><div>[1933]</div><div>[1934]</div><div>[1935]</div><div>[...]</div><div>[1984]</div></div>					
AUTO	200	330	170	159	...	450

K	AUTO[K]

1. Repeat for K = 1932 to 1984:
 Print : K, AUTO[K]
2. Exit.

Traversing a Linear Array

An automobile company uses an array AUTO to record the number of automobile sold each year from 1932 ~ 1984.

- a) Find the **number NUM of years** during which more than 300 automobiles were sold.

	[1932]	[1933]	[1934]	[1935]	[...]	[1984]
AUTO	200	330	170	159	...	450

K	AUTO[K]	AUTO[K] > 300	NUM=0

1. Set NUM : = 0.
2. Repeat for K = 1932 to 1984:
 if AUTO[K] > 300,
 then : set NUM : = NUM+1
3. Exit.

Traversing a Linear Array

An automobile company uses an array AUTO to record the number of auto mobile sold each year from 1932 ~ 1984.

- a) Print each year and the no. of automobiles sold in that year
- b) Find the number NUM of years during which more than 300 automobiles were sold.

```
1. Repeat for K = 1932 to 1984:  
    Print : K, AUTO[K]  
2. Exit.
```

```
1. Set NUM := 0.  
2. Repeat for K = 1932 to 1984:  
    if AUTO[K] > 300,  
        then : set NUM := NUM+1  
3. Exit.
```

Insert into Linear Array

4.2: (Inserting into a Linear Array) INSERT (LA, N, K, ITEM)

Here LA is a linear array with N elements and K is a positive integer such that $K \leq N$. This algorithm inserts an element ITEM into the Kth position in LA.

1. [Initialize counter.] Set $J := N$.
2. Repeat Steps 3 and 4 while $J \geq K$.
3. [Move Jth element downward.] Set $LA[J + 1] := LA[J]$.
4. [Decrease counter.] Set $J := J - 1$.
[End of Step 2 loop.]
5. [Insert element.] Set $LA[K] := \text{ITEM}$.
6. [Reset N.] Set $N := N + 1$.
7. Exit.

Insert into Linear Array

Here LA is a linear array with N elements and K is a positive integer such that $K \leq N$. This algorithm inserts an element ITEM into the K th position in LA.

Insert into Linear Array

ITEM = 27 K = 4

4.2: (Inserting into a Linear Array) INSERT (LA, N, K, ITEM)

Here LA is a linear array with N elements and K is a positive integer such that $K \leq N$. This algorithm inserts an element ITEM into the Kth position in LA.

1. [Initialize counter.] Set $J := N$.

2. Repeat Steps 3 and 4 while $J \geq K$.

3. [Move Jth element downward.] Set $LA[J + 1] := LA[J]$.

4. [Decrease counter.] Set $J := J - 1$.

[End of Step 2 loop]

5. [Insert element.] Set $LA[K] := \text{ITEM}$.

6. [Reset N.] Set $N := N + 1$.

7. Exit.

$J = 6$

$LA[4] = 27$

$N = N + 1$

While($J \geq K$)

{

$LA[J+1] = LA[J];$

$J = J - 1;$

}

Insert into Linear Array

```
#include <stdio.h>
#include <stdlib.h>

void main() {
    int i, J, N, K=51, LA[101], ITEM=106;
    /* where, */
    /* N = number of element */
    /* K = position or index number */
    /* LA = array name */
    /* ITEM = insert elements value */
    N = 100;
    J = N;

    for(i=0; i<100; i++)
        LA[i] = rand()%1000;

    while(J>=K) {
        LA[J+1] = LA[J];
        J=J-1;
    }
    LA[K] = ITEM;
    N=N+1;
    printf("ITEM %d inserted at position %d \n", LA[K],K);
}
```

Deleting from Linear Array

4.3: (Deleting from a Linear Array) DELETE(LA, N, K, ITEM)

Here LA is a linear array with N elements and K is a positive integer such that $K \leq N$. This algorithm deletes the Kth element from LA.

1. Set $ITEM := LA[K]$.

2. Repeat for $J = K$ to $N - 1$:

[Move J + 1st element upward.] Set $LA[J] := LA[J + 1]$.

[End of loop.]

3. [Reset the number N of elements in LA.] Set $N := N - 1$.

4. Exit.

Deleting from Linear Array

Here LA is a linear array with N elements and K is a positive integer such that $K \leq N$. This algorithm deletes the Kth element from LA.

$$K = 4$$
$$4 \leq 6$$

LA		N = 6
10	1	
12	2	
5	3	
7	4	
15	5	
16	6	

Deleting from Linear Array

$K = 4$

4.3: (Deleting from a Linear Array) DELETE(LA, N, K, ITEM)

Here LA is a linear array with N elements and K is a positive integer such that $K \leq N$. This algorithm deletes the Kth element from LA.

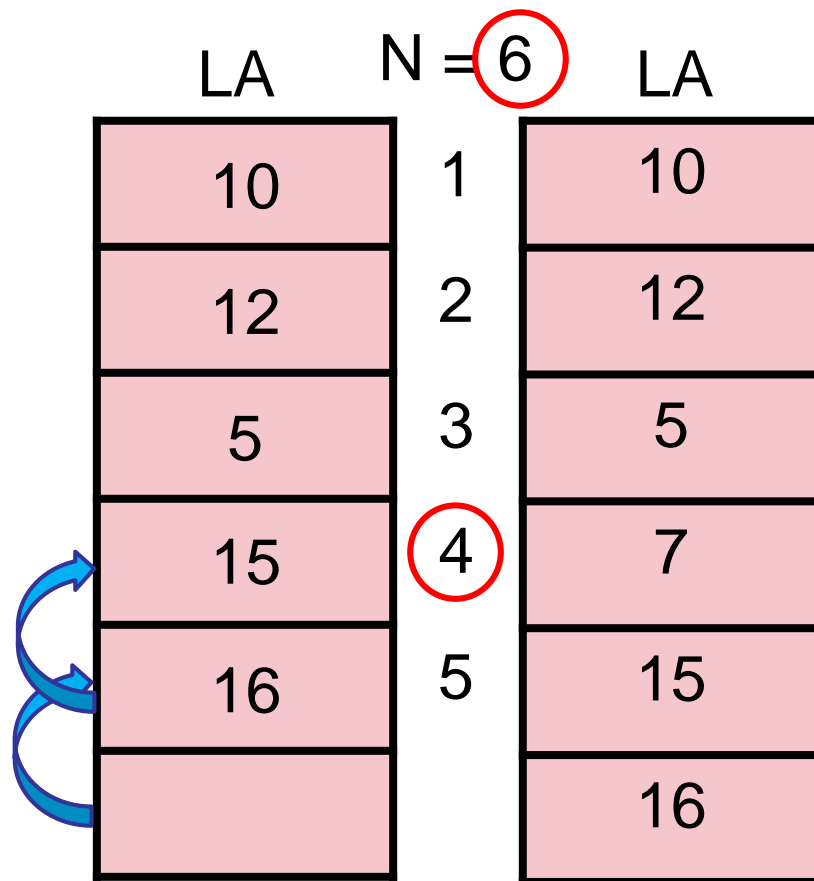

1. Set $ITEM := LA[K]$.
2. Repeat for $J = K$ to $N - 1$:
 [Move $J + 1$ st element upward.] Set $LA[J] := LA[J + 1]$
 [End of loop.]
3. [Reset the number N of elements in LA.] Set $N := N - 1$.
4. Exit.

$ITEM = LA[4] = 7$

$N = N - 1$

i.e. $N = 6 - 1 = 5$

```
for(J=K; J≤N-1; K++)  
{  
    LA[J]=LA[J+1];  
}
```

Deleting from Linear Array

```
#include <stdio.h>
#include <stdlib.h>

void main() {
    int i, J, N=100, K=51, ITEM, LA[100];

    /* where, */
    /* N = number of element */
    /* K = position or index number */
    /* LA = array name */
    /* ITEM = delete elements value */

    for(i=0; i<100; i++)
        LA[i] = rand()%1000;

    ITEM = LA[K];

    for(J=K; J<=N-1; J++)
        LA[J] = LA[J+1];

    N=N-1;

    printf("ITEM %d deleted from position %d\n", ITEM,K);
}
```

Linear Search

4.5: (Linear Search) LINEAR(DATA, N, ITEM, LOC)

Here DATA is a linear array with N elements, and ITEM is a given item of information. This algorithm finds the location LOC of ITEM in DATA, or sets $LOC := 0$ if the search is unsuccessful.

1. [Insert ITEM at the end of DATA.] Set $DATA[N + 1] := ITEM$.
2. [Initialize counter.] Set $LOC := 1$.
3. [Search for ITEM.]
Repeat while $DATA[LOC] \neq ITEM$:
Set $LOC := LOC + 1$.
[End of loop.]
4. [Successful?] If $LOC = N + 1$, then: Set $LOC := 0$.
5. Exit.

Linear Search

```
#include <stdio.h>

void main() {
    int DATA[11]={8,2,5,9,1,4,7,10,3,6},
    i, n=10, ITEM=100, LOC;

    DATA[n+1]=ITEM;
    LOC=0;

    while(DATA[LOC]!=ITEM) {
        LOC=LOC+1;
    }

    if (LOC==n+1) {
        LOC=-1;
    }

    if (LOC==-1) {
        printf("\n ITEM is not in the List\n");
    }
    else{
        printf("\n ITEM found at Position %d \n", LOC);
    }
}
```

Linear Search

```
#include <stdio.h>
```

```
void main() {
```

```
    int DATA[11]={8,2,5,9,1,4,7,10,3,6},  
    i, n=10, ITEM=100, LOC;
```

```
    DATA[n+1]=ITEM;  
    LOC=0;
```

```
    while (DATA[LOC] != ITEM) {  
        LOC=LOC+1;  
    }
```

```
    if (LOC==n+1) {  
        LOC=-1;  
    }
```

```
    if (LOC== -1) {  
        printf("\n ITEM is not in the List\n");  
    }  
    else{  
        printf("\n ITEM found at Position %d \n", LOC);  
    }  
}
```

4.5: (Linear Search) LINEAR(DATA, N, ITEM, LOC)

Here DATA is a linear array with N elements, and ITEM is a given item of information. This algorithm finds the location LOC of ITEM in DATA, or sets LOC := 0 if the search is unsuccessful.

1. [Insert ITEM at the end of DATA.] Set DATA[N + 1] := ITEM.
2. [Initialize counter.] Set LOC := 1.
3. [Search for ITEM.]
Repeat while DATA[LOC] \neq ITEM:
Set LOC := LOC + 1.
[End of loop.]
4. [Successful?] If LOC = N + 1, then: Set LOC := 0.
5. Exit.

Binary Search

4.6: (Binary Search) BINARY(DATA, LB, UB, ITEM, LOC)

Here DATA is a sorted array with lower bound LB and upper bound UB, and ITEM is a given item of information. The variables BEG, END and MID denote, respectively, the beginning, end and middle locations of a segment of elements of DATA. This algorithm finds the location LOC of ITEM in DATA or sets LOC = NULL.

1. [Initialize segment variables.]

Set $BEG := LB$, $END := UB$ and $MID = \text{INT}((BEG + END)/2)$.

2. Repeat Steps 3 and 4 while $BEG \leq END$ and $DATA[MID] \neq ITEM$.

3. If $ITEM < DATA[MID]$, then:

Set $END := MID - 1$.

Else:

Set $BEG := MID + 1$.

[End of If structure.]

4. Set $MID := \text{INT}((BEG + END)/2)$.

[End of Step 2 loop.]

5. If $DATA[MID] = ITEM$, then:

Set $LOC := MID$.

Else:

Set $LOC := \text{NULL}$.

[End of If structure.]

6. Exit.

BEG
END
MID

Binary Search

Simulate binary search algorithm on the array

2, 3, 6, 8, 10, 12, 14, 16, 17, 23, 26

when **2**, **26**, and **15** are searched showing values of BEG/LOW, END/HIGH, MID, Comparison and Found in a table.

Iteration	BEG	END	MID	Comparison	Found

Binary Search (Complexity Analysis)

Initial Length of
array = n

6	13	14	25	33	43	51	53	64	72	84	93	95	96	97
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
↑ BEG						↑ END								

At Iteration 1:
Length of array
 $= \frac{n}{2}$

6	13	14	25	33	43	51	53	64	72	84	93	95	96	97
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
↑ BEG						↑ END								

At Iteration 2:
Length of array
 $= \frac{n/2}{2} = \frac{n}{4} = \frac{n}{2^2}$

6	13	14	25	33	43	51	53	64	72	84	93	95	96	97
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
				↑ BEG			↑ END							

Binary Search (Complexity Analysis)

At Iteration 3:
 Length of array
 $= \frac{n/2}{4} = \frac{n}{8} = \frac{n}{2^3}$

6	13	14	25	33	43	51	53	64	72	84	93	95	96	97
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14

After Iteration k:

Length of array = $\frac{n}{2^k}$

After k iterations,
 the length of the array becomes 1

Therefore, $\frac{n}{2^k} = 1$

$$n = 2^k$$

$$2^k = n$$

$$\log_2 2^k = \log_2 n$$

$$k \log_2 2 = \log_2 n$$

$$k \cdot 1 = \log_2 n$$

$$k = \log_2 n$$

Binary Search (Complexity Analysis)

Consider an array with 64 elements. Estimate the number of iterations required in worst case scenario while using the Binary search algorithm.

The number of iterations required while considering the worst case in Binary search, $k = \log_2 n$

$$\begin{aligned}\text{Here, } n &= 64 \text{ Therefore, } k = \log_2 64 \\ &= \log_2 2^6 \\ &= 6 \log_2 2 \\ &= 6 \cdot 1 \\ &= 6\end{aligned}$$

Binary Search

Consider an array with **100** elements. Estimate the number of iterations required in worst case scenario while using the Binary search algorithm.

The number of iterations required while considering the worst case in Binary search, $k = \log_2 n$

$$\begin{aligned} \text{Here, } n = 100 \text{ Therefore, } k &= \log_2 100 &= \log_2 2^7 \\ &= \log_2 2^{6.65} &= 7 \log_2 2 \\ &= \log_2 2^{[6.65]} &= 7.1 \\ & &= 7 \end{aligned}$$

Binary Search (Complexity Analysis)

```
#include <stdio.h>

void main()
{
    int LB, UB, BEG, END, MID, DATA[7]={2,5,7,9,11,13,15}, ITEM=1;
    LB=0;
    UB=6;
    BEG=LB;
    END=UB;
    MID=(int) ((BEG+END)/2);

    while( (BEG<=END) && (DATA[MID]!=ITEM) )
    {
        if(ITEM<DATA[MID])
            END=MID-1;
        else
            BEG=MID+1;

        MID=(int) ((BEG+END)/2);
    }

    if(DATA[MID]==ITEM)
        printf("LOC = %d", MID);
    else
        printf("ITEM is not in the list.");
}
```

Binary Search (Complexity Analysis)

4.6: (Binary Search) BINARY(DATA, LB, UB, ITEM, LOC)
Here DATA is a sorted array with lower bound LB and upper bound UB, and ITEM is a given item of information. The variables BEG, END and MID denote, respectively, the beginning, end and middle locations of a segment of elements of DATA. This algorithm finds the location LOC of ITEM in DATA or sets LOC = NULL.

1. [Initialize segment variables.]

Set $BEG := LB$, $END := UB$ and $MID = \text{INT}((BEG + END)/2)$.

2. Repeat Steps 3 and 4 while $BEG \leq END$ and $DATA[MID] \neq ITEM$.

3. If $ITEM < DATA[MID]$, then:

Set $END := MID - 1$.

Else:

Set $BEG := MID + 1$.

[End of If structure.]

4. Set $MID := \text{INT}((BEG + END)/2)$.

[End of Step 2 loop.]

5. If $DATA[MID] = ITEM$, then:

Set $LOC := MID$.

Else:

Set $LOC := \text{NULL}$.

[End of If structure.]

6. Exit.

```
#include <stdio.h>
```

```
void main()
```

```
{
```

```
    int LB, UB, BEG, END, MID, DATA[7]={2,5,7,9,11,13,15}, ITEM=1;
```

```
    LB=0;
```

```
    UB=6;
```

```
    BEG=LB;
```

```
    END=UB;
```

```
    MID=(int)((BEG+END)/2);
```

```
    while((BEG<=END) && (DATA[MID]!=ITEM))
```

```
    {
```

```
        if(ITEM<DATA[MID])
```

```
            END=MID-1;
```

```
        else
```

```
            BEG=MID+1;
```

```
    MID=(int)((BEG+END)/2);
```

```
    }
```

```
    if(DATA[MID]==ITEM)
```

```
        printf("LOC = %d", MID);
```

```
    else
```

```
        printf("ITEM is not in the list.");
```

```
}
```

Sorting Linear Array (Bubble Sort)

Sorting takes an **unordered** collection and makes it an **ordered** one

Bubble Sort

4.4: (Bubble Sort) BUBBLE(DATA, N)

Here DATA is an array with N elements. This algorithm sorts the elements in DATA.

1. Repeat Steps 2 and 3 for $K = 1$ to $N - 1$.
2. Set $PTR := 1$. [Initializes pass pointer PTR.]
3. Repeat while $PTR \leq N - K$: [Executes pass.]
 - (a) If $DATA[PTR] < DATA[PTR + 1]$, then:
Interchange $DATA[PTR]$ and $DATA[PTR + 1]$.
[End of If structure.]
 - (b) Set $PTR := PTR + 1$.
[End of inner loop.][End of Step 1 outer loop.]
4. Exit.

Bubble Sort

"Bubbling Up" the Largest Element

Traverse a collection of elements

- Move from the front to the end
- “Bubble” the **largest value** to the end using **pair-wise comparisons and swapping**

1	2	3	4	5	6
77	42	35	12	101	5

Bubble Sort

Traverse a collection of elements

- Move from the front to the end
- “Bubble” the **largest value** to the end using **pair-wise comparisons and swapping**

No. of Comparisons:

No. of Swap:

- “Bubble” the **largest value** to the end using **pair-wise comparisons and swapping**

1	2	3	4	5	6
42	35	12	77	5	101

Largest value correctly placed

No. of Comparisons:

No. of Swap:

Bubble Sort

- ❖ Notice that only the **largest value** is correctly placed
- ❖ All other values are still out of order
- ❖ So we need to **repeat this process**

1	2	3	4	5	6
42	35	12	77	5	101

Largest value correctly placed

Bubble Sort

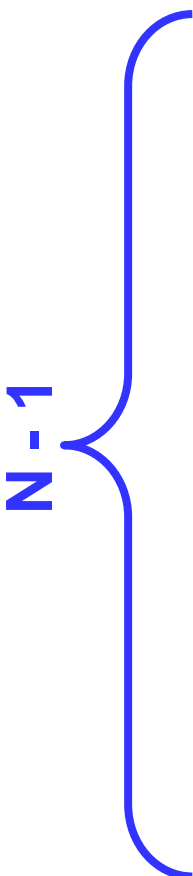

- ✿ If we have N elements
- ✿ And if each time we bubble an element, we place it in its correct location
- ✿ Then we repeat the “bubble up” process $N - 1$ times.
- ✿ This guarantees we'll correctly place all N elements.

“Bubbling” All the Elements

1	2	3	4	5	6
42	35	12	77	5	101
35	12	42	5	77	101
12	35	5	42	77	101
12	5	35	42	77	101
5	12	35	42	77	101

Reducing the Number of Comparisons

1	2	3	4	5	6
77	42	35	12	101	5
1	2	3	4	5	6
42	35	12	77	5	101
1	2	3	4	5	6
35	12	42	5	77	101
1	2	3	4	5	6
12	35	5	42	77	101
1	2	3	4	5	6
12	5	35	42	77	101

Reducing the Number of Comparisons

- On the N^{th} “bubble up”, we only need to do **MAX-N comparisons**.
- For example:
 - This is the 4th “bubble up”
 - MAX is 6
 - Thus we have **2 comparisons** to do

Bubble Sort Implementation

```
#include<stdio.h>

void main(){
    int DATA[20]={10,13,7,9,2,5,8,17,1,11,6,19,12,18,4,14,3,15,20,16},
    i, K, N=20, PTR, temp;

    for( K=1; K<=N-1; K++){
        PTR=0;
        while (PTR<=N-K){
            if(DATA[PTR]>DATA[PTR+1]){
                temp=DATA[PTR];
                DATA[PTR]=DATA[PTR+1];
                DATA[PTR+1]=temp;
            }
            PTR=PTR+1;
        }
    }

    printf("After sorting the Array is: \n\n");
    for(i=0;i<N;i++)
        printf(" %d", DATA[i]);
    printf("\n");
}
```

Complexity Analysis of Bubble Sort

Sum of arithmetic series formula

$$\text{Sum} = \frac{\text{number of terms}}{2} \times (\text{first term} + \text{last term})$$

The sum S_n of $a_1 + a_2 + a_3 + a_4 + \dots + a_n$ is

$$S_n = \frac{n}{2} \times (a_1 + a_n)$$

Complexity Analysis of Bubble Sort

Traditionally, the time for a sorting algorithm is measured in terms of the number of comparisons. The number $f(n)$ of comparisons in the bubble sort is easily computed. Specifically, there are $n - 1$ comparisons during the first pass, which places the largest element in the last position; there are $n - 2$ comparisons in the second step, which places the second largest element in the next-to-last position; and so on. Thus

$$f(n) = (n - 1) + (n - 2) + \dots + 2 + 1 = \frac{n(n-1)}{2} = \frac{n^2}{2} + O(n) = O(n^2)$$

In other words, the time required to execute the bubble sort algorithm is proportional to n^2 , where n is the number of input items.
